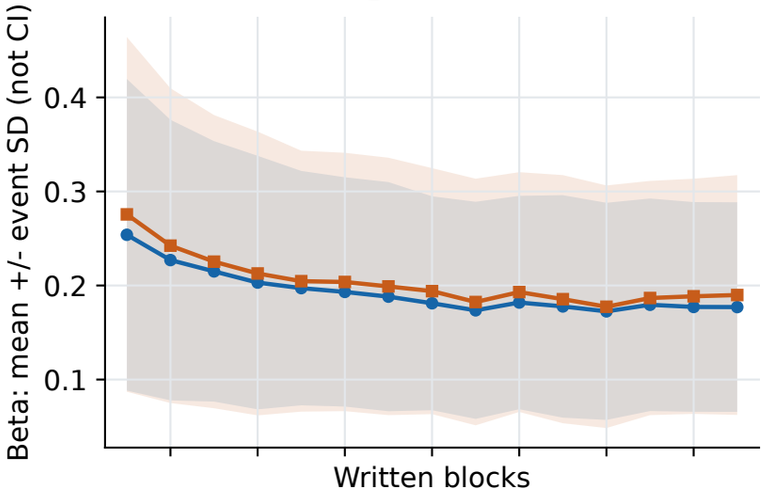
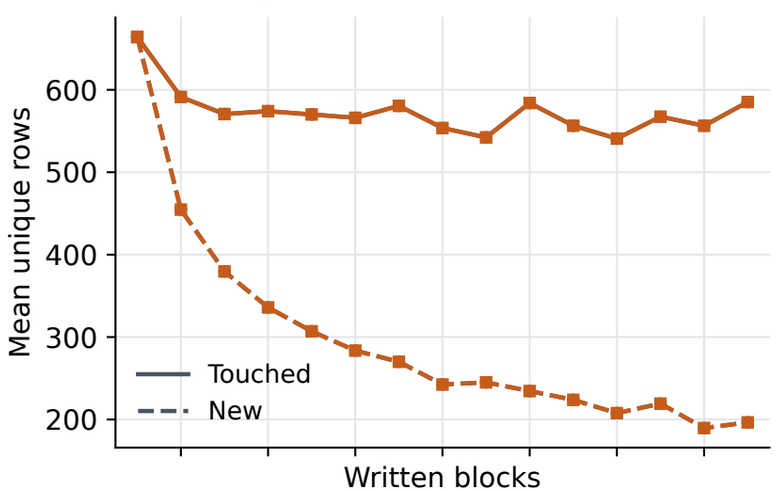
Primary / self: actual writes and query access

Seed 17 Seed 29

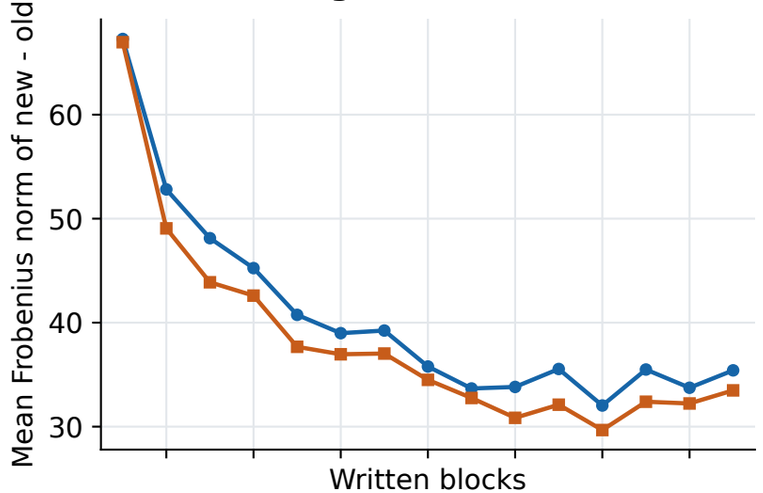
A Actual write gates



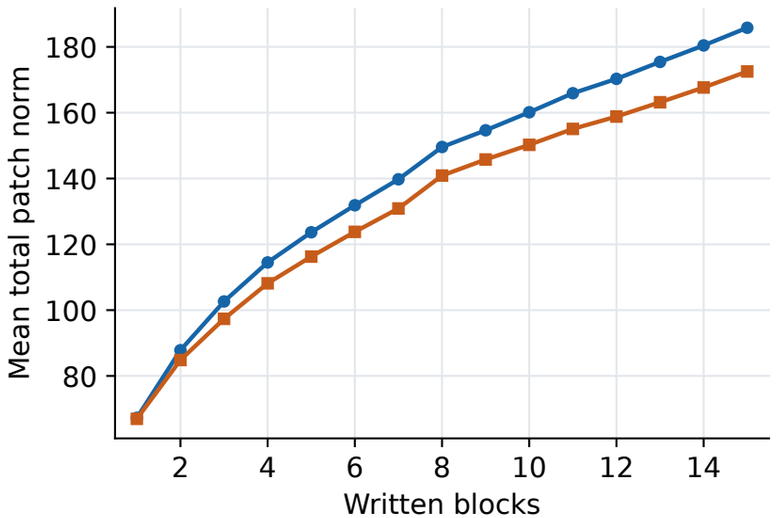
B Rows per write block



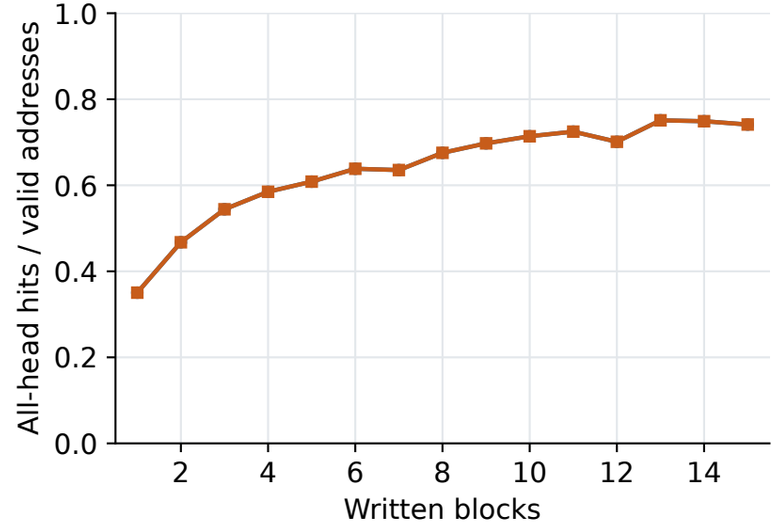
C Patch change



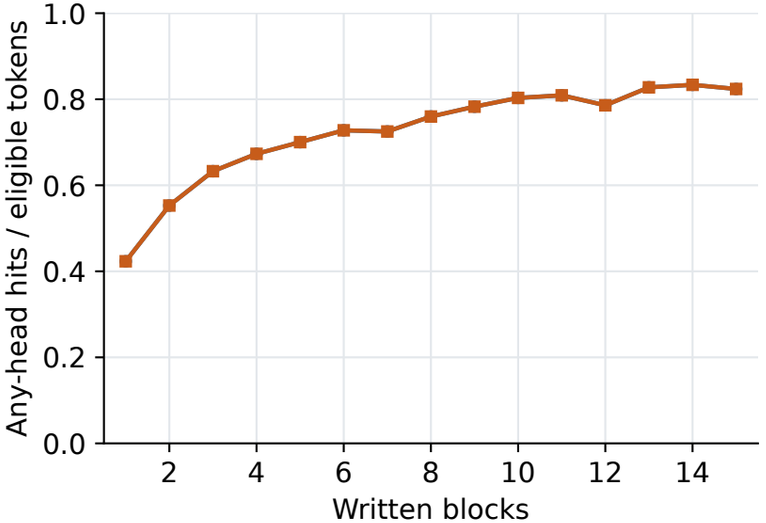
D Whole patch



E Query addresses



F Query target tokens



Beta moments are weighted by finite write events; shaded bands show event standard deviation, not confidence intervals.
Row/norm curves average write-block scalars. Hit rates use summed hit counts / summed denominators. No block quantiles are averaged.
Later depths contain fewer eligible windows. Nonfinite beta events: seed 17 = 0, seed 29 = 0.
